

SCAN90CP02

1.5 Gbps 2x2 LVDS Crosspoint Switch with Pre-Emphasis and IEEE 1149.6

General Description

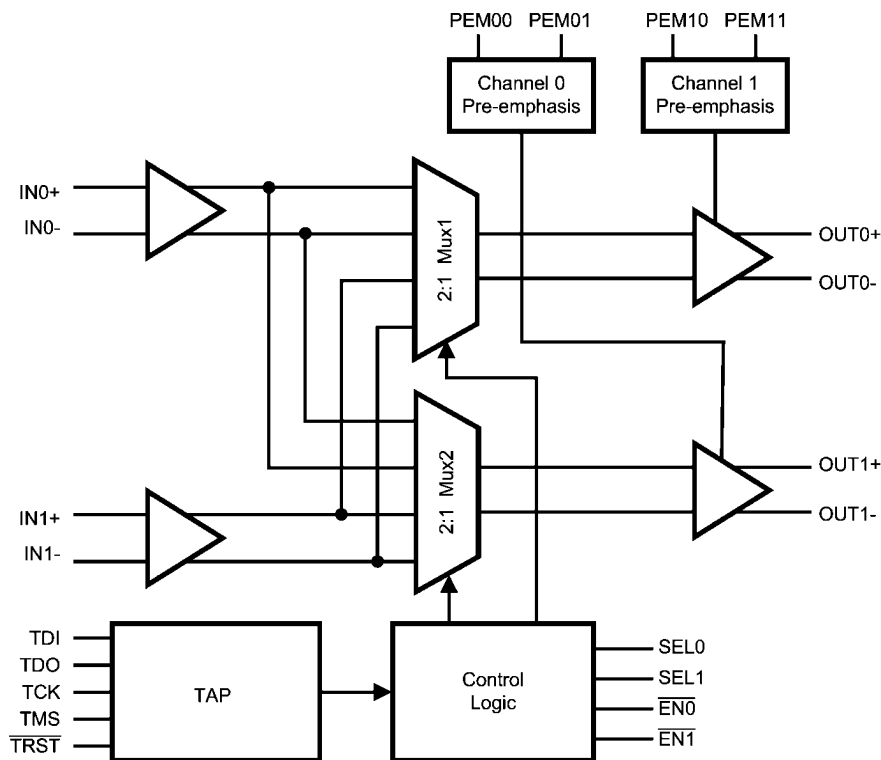

The SCAN90CP02 is a 1.5 Gbps 2 x 2 LVDS crosspoint switch. High speed data paths and flow-through pinout minimize internal device jitter, while configurable 0/25/50/100% pre-emphasis overcomes external ISI jitter effects of lossy backplanes and cables. The differential inputs interface to LVDS and Bus LVDS signals such as those on National's 10-, 16-, and 18-bit Bus LVDS SerDes, as well as CML and LVPECL. The SCAN90CP02 can also be used with ASICs and FPGAs. The non-blocking crosspoint architecture is pin-configurable as a 1:2 clock or data splitter, 2:1 redundancy mux, crossover function, or dual buffer for signal booster and stub hider applications.

Integrated IEEE 1149.1 (JTAG) and 1149.6 circuitry supports testability of both single-ended LVTTL/CMOS and differential LVDS PCB interconnect. The 3.3V supply, CMOS process, and LVDS I/O ensure high performance at low power over the entire industrial -40 to +85°C temperature range.

Features

- 1.5 Gbps per channel
- Low power: 70 mA in dual repeater mode @1.5 Gbps
- Low output jitter
- Configurable 0/25/50/100% pre-emphasis drives lossy backplanes and cables
- Non-blocking architecture allows 1:2 splitter, 2:1 mux, crossover, and dual buffer configurations
- Flow-through pinout
- LVDS/BLVDS/CML/LVPECL inputs, LVDS Outputs
- IEEE 1149.1 and 1149.6 compliant
- Single 3.3V supply
- Separate control of inputs and outputs allows for power savings
- Industrial -40 to +85°C temperature range
- 28-lead LLP package, or 32-lead LQFP package

Pin Descriptions

Pin Name	LLP Pin Number	LQFP Pin Number	I/O, Type	Description
DIFFERENTIAL INPUTS COMMON TO ALL MUXES				
IN0+	9	9	I, LVDS	Inverting and non-inverting differential inputs. LVDS, Bus LVDS, CML, or LVPECL compatible.
IN0–	10	10		
IN1+	12	13	I, LVDS	Inverting and non-inverting differential inputs. LVDS, Bus LVDS, CML, or LVPECL compatible.
IN1–	13	14		
SWITCHED DIFFERENTIAL OUTPUTS				
OUT0+	27	32	O, LVDS	Inverting and non-inverting differential outputs. OUT0± can be connected to any one pair IN0±, or IN1±. LVDS compatible (Note 2).
OUT0–	26	31		
OUT1+	24	28	O, LVDS	Inverting and non-inverting differential outputs. OUT1± can be connected to any one pair IN0±, or IN1±. LVDS compatible (Note 2).
OUT1–	23	27		
DIGITAL CONTROL INTERFACE				
SEL0, SEL1	6 5	7 6	I, LVTTTL	Select Control Inputs
EN0, EN1	7 15	8 17	I, LVTTTL	Output Enable Inputs
PEM00, PEM01	4 3	4 3	I, LVTTTL	Channel 0 Output Pre-emphasis Control Inputs
PEM10, PEM11	2 1	2 1	I, LVTTTL	Channel 1 Output Pre-emphasis Control Inputs
TDI	19	22	I, LVTTTL	Test Data Input to support IEEE 1149.1 features
TDO	20	23	O, LVTTTL	Test Data Output to support IEEE 1149.1 features
TMS	18	21	I, LVTTTL	Test Mode Select to support IEEE 1149.1 features
TCK	17	19	I, LVTTTL	Test Clock to support IEEE 1149.1 features
TRST	21	24	I, LVTTTL	Test Reset to support IEEE 1149.1 features
N/C	8, 28			Not Connected
POWER				
V _{DD}	11, 14, 16, 22, 25	12, 16, 18, 25, 29	I, Power	V _{DD} = 3.3V ±0.3V. At least 4 low ESR 0.01 μF bypass capacitors should be connected from V _{DD} to GND plane.
GND	(Note 1)	5, 11, 15, 20, 26, 30		Ground reference to LVDS and CMOS circuitry. For the LLP package, the DAP is used as the primary GND connection to the device. The DAP is the exposed metal contact at the bottom of the LLP-28 package. It should be connected to the ground plane with at least 4 vias for optimal AC and thermal performance.

Note 1: Note that for the LLP package GND is not an actual pin on the package, the GND is connected thru the DAP on the back side of the LLP package.

Note 2: The LVDS outputs do not support a multidrop (BLVDS) environment. The LVDS output characteristics of the SCAN90CP02 device have been optimized for point-to-point backplane and cable applications.

PD = Power Down mode to minimize power consumption

X = Don't Care

* Entering these states is not forbidden, however device operation is not defined in these states.

Pre-Emphasis

The pre-emphasis is used to compensate for long or lossy transmission media. Separate pins are provided for each output to minimize power consumption. Pre-emphasis is programmable to be off or to preset values per the Pre-emphasis Control Selection Table.

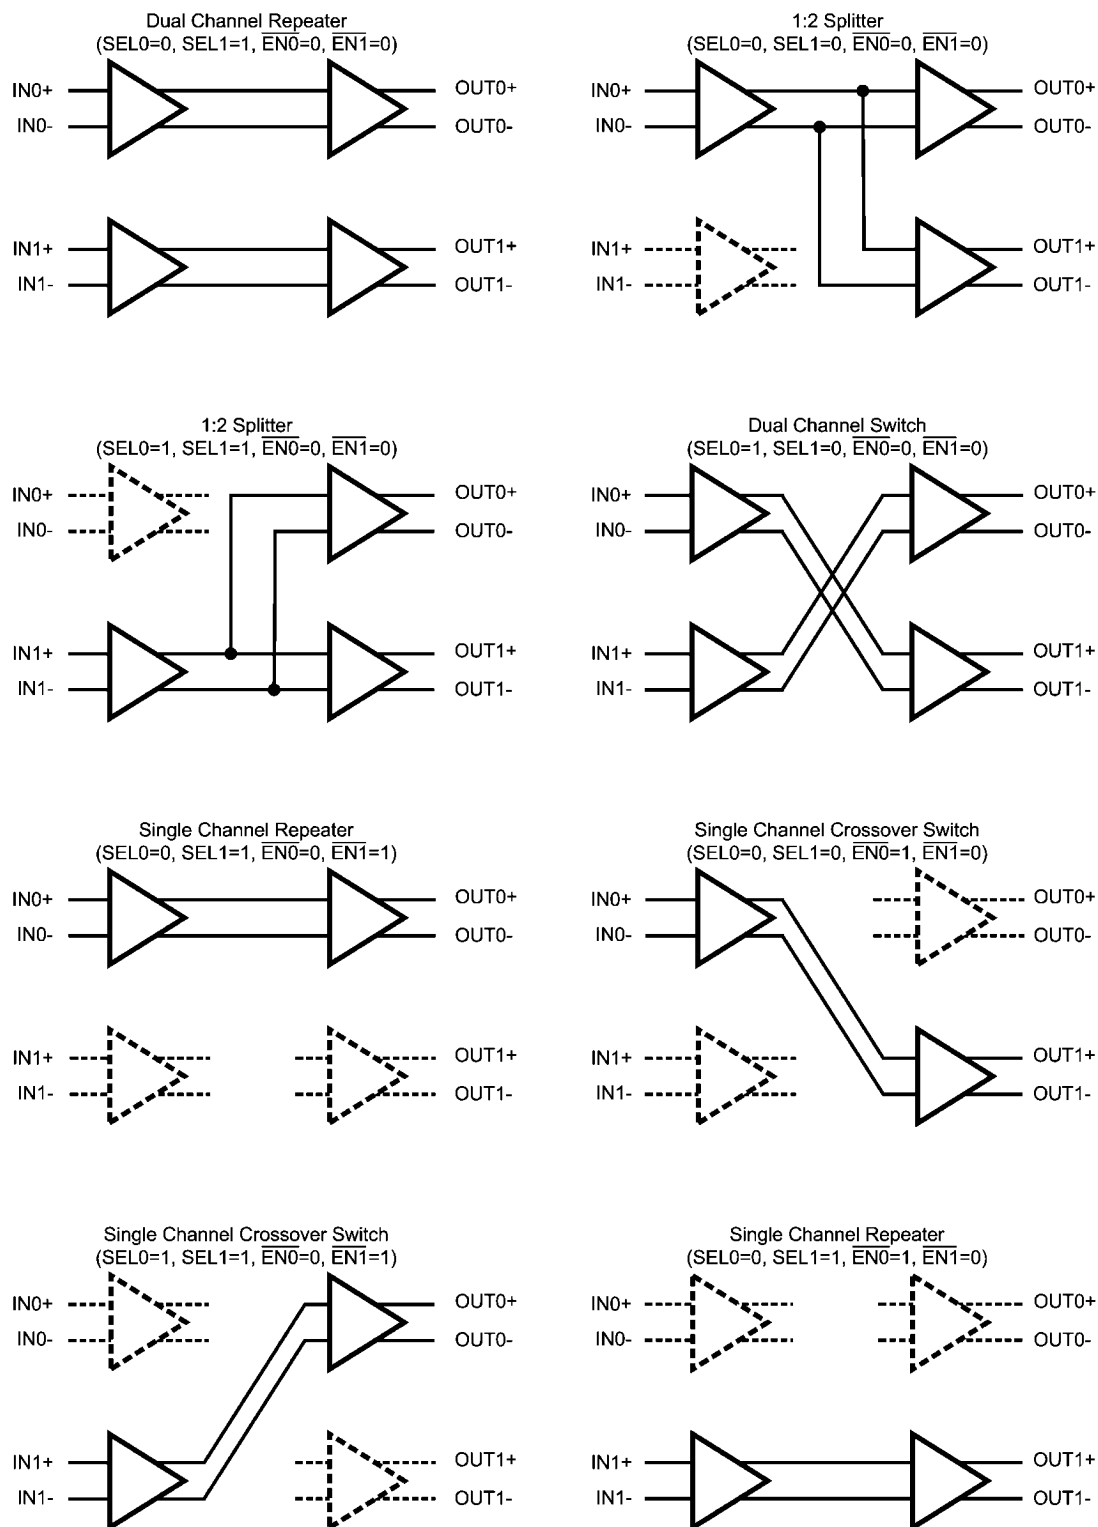

Output Characteristics

The output characteristics of the SCAN90CP02 device have been optimized for point-to-point backplane and cable applications.

Pre-emphasis Control Selection Table

Channel 0		Channel 1		Pre-emphasis

		TJ - PRBS 2 ²³ -1 Pattern	LQFP	113	148	psp-p
		1.5 Gbps (Note 10)	LLP	93	126	psp-p
t _{ON}	LVDS Output Enable Time	Time from $\overline{\text{ENx}}$ to OUT± change from TRI-STATE to active.	50	110	150	ns
t _{OFF}	LVDS Output Disable Time	Time from $\overline{\text{ENx}}$ to OUT± change from active to TRI-STATE.		5	12	ns
t _{SW}	LVDS Switching Time SELx to OUT±	Time from configuration select (SELx) to new switch configuration effective for OUT±.		110	150	ns

SCAN Circuitry Timing Requirements

Symbol	Parameter	Conditions	Min	Typ	Max	Units
f_{MAX}	Maximum TCK Clock Frequency	$R_L = 500\Omega$, $C_L = 35\text{ pF}$	25.0			MHz
t_S	TDI to TCK, H or L		1.0			ns
t_H	TDI to TCK, H or L		2.0			ns
t_S	TMS to TCK, H or L		2.0			ns
t_H	TMS to TCK, H or L		1.5			ns
t_W	TCK Pulse Width, H or L		10.0			ns
t_W	$\overline{\text{TRST}}$ Pulse Width, L		2.5			ns
t_{REC}	Recovery Time, $\overline{\text{TRST}}$ to TCK		2.0			ns

Note 3: "Absolute Maximum Ratings" are the ratings beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits.

Note 4: Typical parameters are measured at $V_{DD} = 3.3\text{V}$, $T_A = 25^\circ\text{C}$. They are for reference purposes, and are not production-tested.

Note 5: Differential output voltage V_{OD} is defined as $\text{ABS}(\text{OUT+} - \text{OUT-})$. Differential input voltage V_{ID} is defined as $\text{ABS}(\text{IN+} - \text{IN-})$.

Note 6: Output offset voltage V_{OS} is defined as the average of the LVDS single-ended output voltages at logic high and logic low states.

Note 7: Jitter is not production tested, but guaranteed through characterization on a sample basis.

Note 8: Random Jitter, or RJ, is measured RMS with a histogram including 1500 histogram window hits. The input voltage = $V_{ID} = 500\text{mV}$, 50% duty cycle at 750MHz, $t_r = t_f = 50\text{ps}$ (20% to 80%).

Note 9: Deterministic Jitter, or DJ, is measured to a histogram mean with a sample size of 350 hits. The input voltage = $V_{ID} = 500\text{mV}$, K28.5 pattern at 1.5 Gbps, $t_r = t_f = 50\text{ps}$ (20% to 80%). The K28.5 pattern is repeating bit streams of (00111111010 1100000101).

Note 10: Total Jitter, or TJ, is measured peak to peak with a histogram including 3500 window hits. Stimulus and fixture jitter has been subtracted. The input voltage = $V_{ID} = 500\text{mV}$, 2²³-1 PRBS pattern at 1.5 Gbps, $t_r = t_f = 50\text{ps}$ (20% to 80%).

Input Interfacing

The SCAN90CP02 accepts differential signals and allow simple AC or DC coupling. With a wide common mode range, the

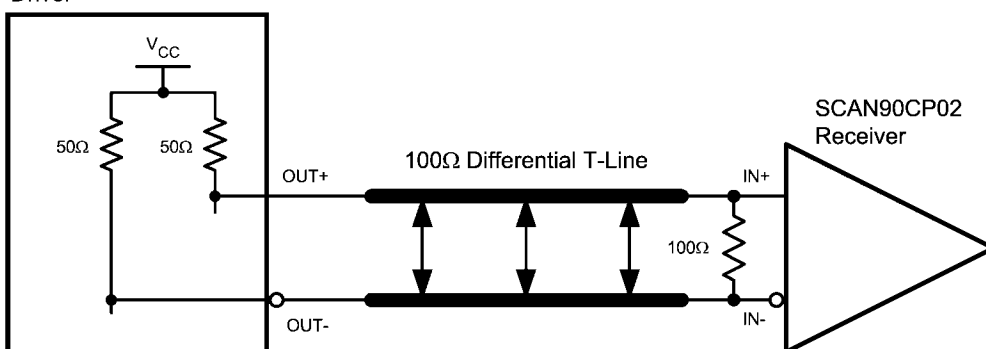

SCAN90CP02 can be DC-coupled with all common differential drivers (i.e. LVPECL, LVDS, CML). The following three figures illustrate typical DC-coupled interface to common differential drivers.

Typical LVDS Driver DC-Coupled Interface to SCAN90CP02 Input

20071422

Typical LVPECL Driver DC-Coupled Interface to SCAN90CP02 Input

20071423

Output Interfacing

The SCAN90CP02 outputs signals that are compliant to the LVDS standard. Their outputs can be DC-coupled to most common differential receivers. The following figure illustrates typical DC-coupled interface to common differential receivers

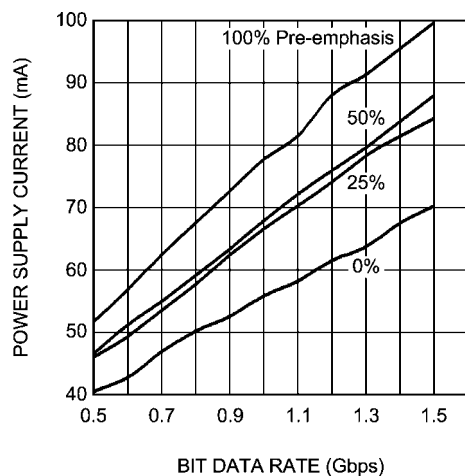

and assumes that the receivers have high impedance inputs. While most differential receivers have a common mode input range that can accommodate LVDS compliant signals, it is recommended to check respective receiver's data sheet prior to implementing the suggested interface implementation.

Typical SCAN90CP02 Output DC-Coupled Interface to an LVDS, CML or LVPECL Receiver

Typical Performance Characteristics for LLP Package

Power Supply Current vs. Bit Data Rate

20071441

Total Jitter (T_J) vs. Bit Data Rate

20071442

Dynamic power supply current was measured while running a PRBS 2²³-1 pattern in dual channel repeater mode. $V_{CC} = 3.3V$, $T_A = +25^\circ C$, $V_{ID} = 0.5V$, $V_{CM} = 1.2V$, 0% Pre-emphasis. Total Jitter measured at 0V differential while running a PRBS 2²³-1 pattern in single channel repeater mode. $V_{CC} = 3.3V$, $T_A = +25^\circ C$, $V_{ID} = 0.5V$, 0% Pre-emphasis.

Total Jitter (T_J) vs. Temperature

20071443

Positive Edge Transition vs. Pre-emphasis Level

20071455

Total Jitter measured at 0V differential while running a PRBS 2²³-1 pattern in dual channel repeater mode. $V_{CC} = 3.3V$, $V_{ID} = 0.5V$, $V_{CM} = 1.2V$, 1.5 Gbps data rate, 0% Pre-emphasis.

FIGURE 7. Typical Performance Characteristics

Design-For-Test (DfT) Features

IEEE 1149.1 SUPPORT

The SCAN90CP02 supports a fully compliant IEEE 1149.1 interface. The Test Access Port (TAP) provides access to boundary scan cells at each LVTTTL I/O on the device for interconnect testing. Differential pins are included in the same boundary scan chain but instead contain IEEE1149.6 cells. IEEE1149.6 is the improved IEEE standard for testing high-speed differential signals.

Refer to the BSDL file located on National's website for the details of the SCAN90CP02 IEEE 1149.1 implementation.

IEEE 1149.6 SUPPORT

AC-coupled differential interconnections on very high speed (1+ Gbps) data paths are not testable using traditional IEEE 1149.1 techniques. The IEEE 1149.1 structures and methods are intended to test static (DC-coupled), single ended networks. IEEE1149.6 is specifically designed for testing high-speed differential, including AC coupled networks.

The SCAN90CP02 is intended for high-speed signalling up to 1.5 Gbps and includes IEEE1149.6 on all differential inputs and outputs.

FAULT INSERTION

Fault Insertion is a technique used to assist in the verification and debug of diagnostic software. During system testing faults are "injected" to simulate hardware failure and thus help verify the monitoring software can detect and diagnose these faults. In the SCAN90004 an IEEE1149.1 "stuck-at" instruction can create a stuck-at condition, either high or low, on any pin or combination of pins.

A more detailed description of the stuck-at feature can be found in NSC Applications note AN-1313.
